

# Azure Web App

Name: Naveen G

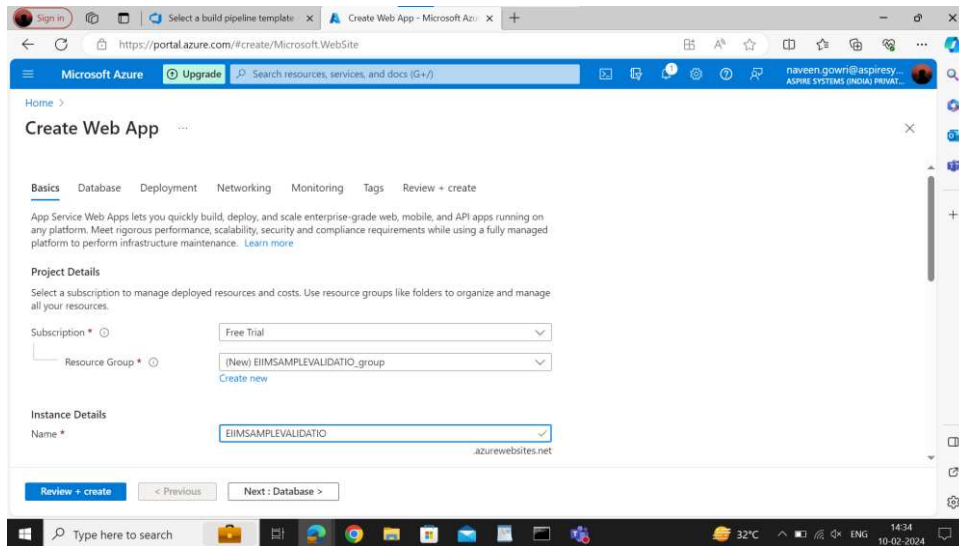

## Step1

Create a web app using App Services

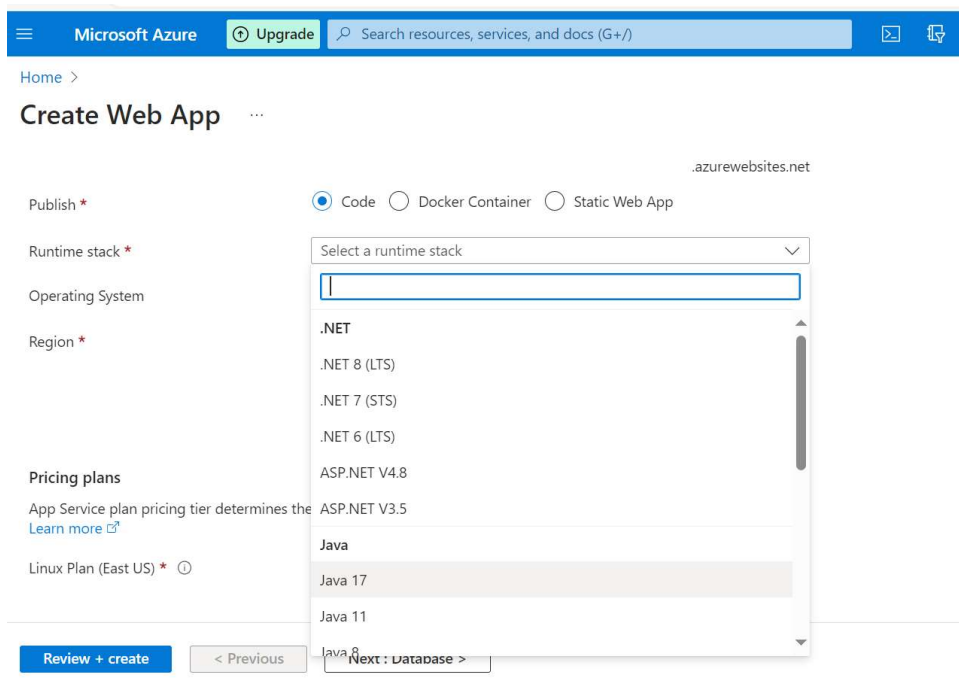

## Step 2

Select Web services and use the create option to create different configuration of web applications

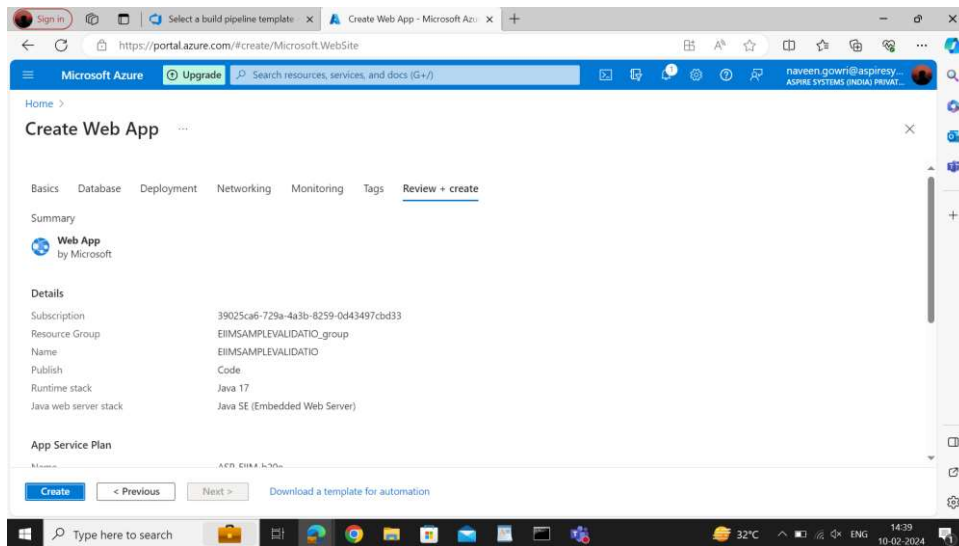

### Step 3

Name the instance which can be used for creating a URL to access the web app

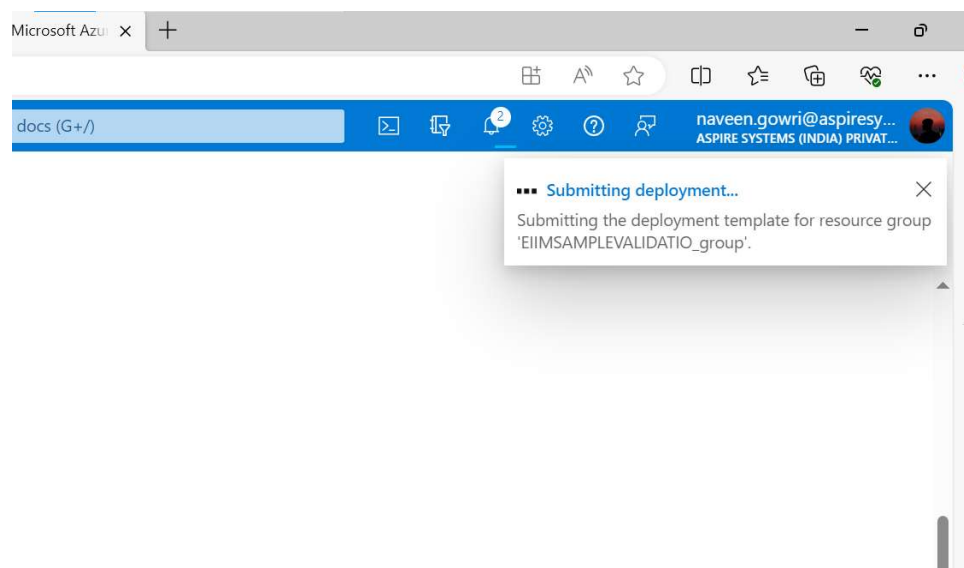

### Step 4

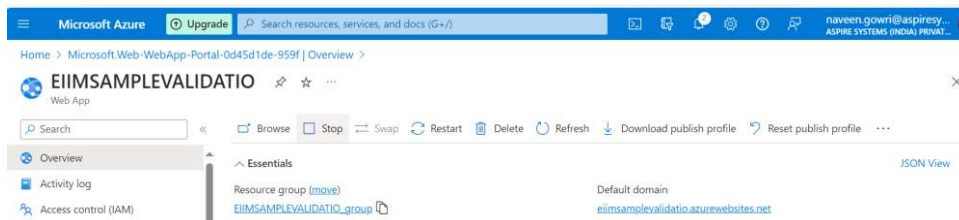

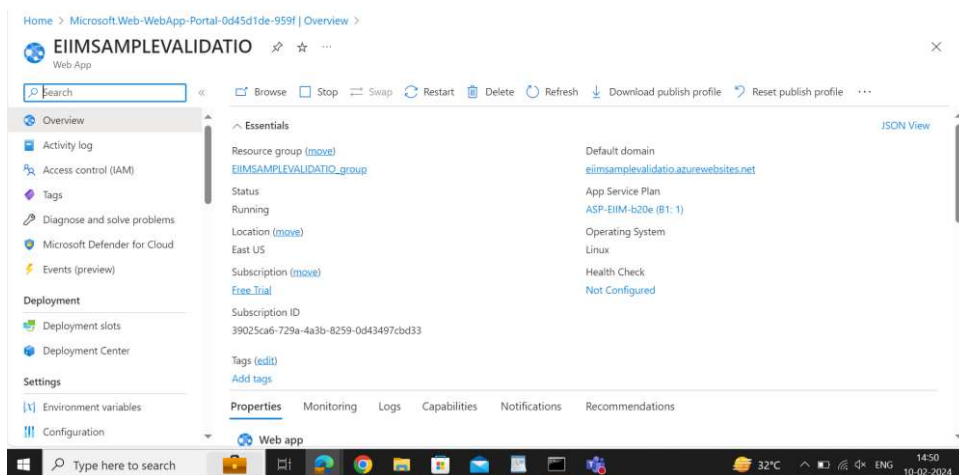

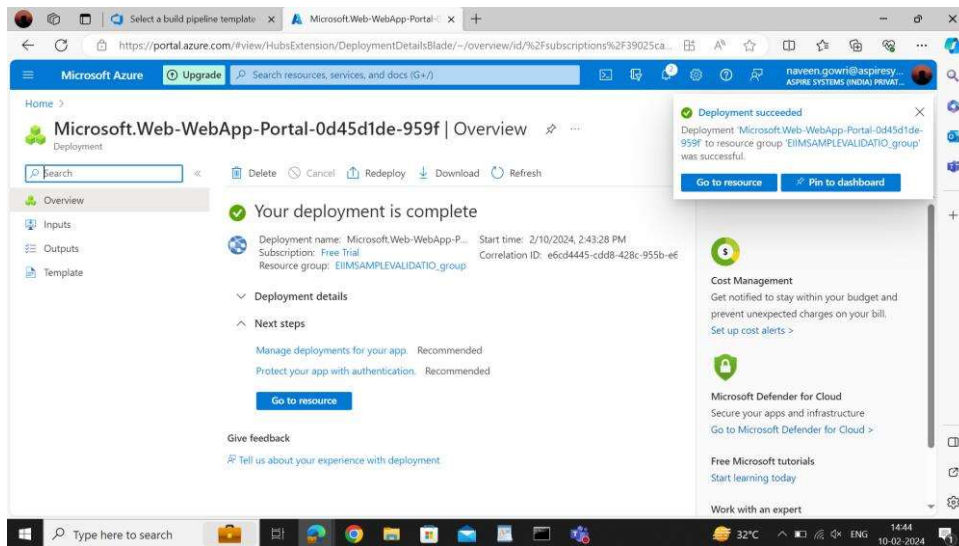

Select the runtime stack which supports the developed project.

## Step 5

Review the instance details and create the instance and wait for the instance to be deployed.

Here we can stop / start the web app and we can even delete the web application.
